

Logic Model -- Ecology and Integrated Management of Ambrosia Beetles in Eastern US Orchard and Ornamental Tree Crops

Situation	Inputs	Outputs	Participants	Short Term	Medium Term	Long Term
<p>Non-native ambrosia beetles damage and kill fruit, nut, and ornamental tree crops</p> <p>Optimization of agricultural applications and repellent technologies based on key ambrosia beetle species, beetle phenology, and plant stress indicators is needed</p> <p>The diversity, pathogenicity, and virulence of auxiliary fungi associated with ambrosia beetles is unknown</p> <p>Reliable ambrosia beetle monitoring systems are needed that are low maintenance and that accurately reflect the risk of host crop attack</p> <p>Indicators (ethanol production of physiological) of host stress are not apparent prior beetle attack or host decline</p> <p>Little economic data on ambrosia beetle associated losses nor on cost inputs for the comparative scenarios of disease prevention versus disease clean-up.</p>	<p>Trans-disciplinary team with extensive experience in IPM, ambrosia beetle biology and management</p> <p>applied phytopathology, agricultural economics, and extension</p> <p>Stakeholder input (e.g. growers, consultants, cooperative extension, industry)</p> <p>USDA SCRI Funds</p> <p>Platforms for dissemination of information (e.g. Southern Appalachian Extension Portal)</p> <p>Research, extension and education expertise and technical support</p> <p>Field research and laboratory facilities of PD co-PDs, and collaborators at UGA, NCSU, Cornell Univ., USDA-ARS, Clemson Univ, UF, PSU, Tenn. St Univ., and Virginia Tech</p> <p>Supplies and laboratory equipment</p> <p>Online trainings and additional extension deliverables</p> <p>Graduate students, postdocs and technicians</p> <p>Advisory Panel</p>	<p>Predict the risk of ambrosia beetle infestation in high value orchard and nursery crop systems through improved understanding of beetle biology and ecology</p> <p>Develop new tools and technologies to enhance the accuracy and precision of host and beetle monitoring strategies</p> <p>Develop and optimize integrated management strategies for ambrosia beetles that include conventional insecticides and fungicides, plant growth regulators, host defense inducers, biological control agents, and behavioral modification compounds</p> <p>Conduct robust extension programming to advise stakeholders on novel ambrosia beetle management paradigms based on economic analyses and research generated data</p> <p>Develop economic models for each cropping system to identify profit maximizing and risk minimizing ambrosia beetle control strategies</p>	<p>Extension educators</p> <p>Apple growers</p> <p>Pear growers</p> <p>Crop consultants</p> <p>Extension specialists</p> <p>Researchers: Plant Pathology, and genetics, Entomology, Horticultural Science, and Agricultural Economics</p> <p>University research station managers and staff</p> <p>Undergraduate and graduate researchers</p> <p>Agrichemical companies</p>	<p>Enhanced stakeholder awareness of ambrosia beetle associated tree decline and factors contributing to their attack</p> <p>Stakeholder knowledge on ineffective management paradigms for ambrosia beetle management is improved</p> <p>The risk of phytopathogen introduction by ambrosia beetles and its contribution to tree decline is defined</p> <p>The relative risk of ambrosia beetle infestation due to abiotic and biotic stress events to host trees is developed</p> <p>Novel diverse management strategies for ambrosia beetle management are identified</p> <p>Early tree stress is identified through improved ethanol detection technologies and ambrosia beetle monitoring systems</p> <p>Stakeholder cost/benefit analyses for ambrosia beetles is improved through the development economic models in each cropping system</p>	<p>Attacks by and tree decline due to ambrosia beetles and associated auxiliary phytopathogens will be reduced as growers mitigate host stress by implementing cultural strategies and improving disease management programs</p> <p>Growers diversify ambrosia beetle management programs to include repellents, phytohormones, resistance inducers, biologicals, and cultural practices</p> <p>Stakeholders deploy novel technologies and traps to monitor host stress and ambrosia beetles, ultimately reducing host decline and death that is related to ambrosia beetle infestation</p> <p>The application frequency of ineffective insecticides for ambrosia beetle management decreases resulting in cost-savings for stakeholders</p>	<p>Increased profits of the ornamental, nut, and fruit tree industries due to a reduction in tree loss and an increase in crop yields</p> <p>Improved productivity with less input costs and reduced environmental and non-target organism impact</p> <p>Maintenance of the eastern US ornamental nurseries and fruit and nut commercial orchards as leaders in production and host quality</p> <p>Additional funding opportunities to continue the development of sustainable management paradigms for ambrosia beetles in the United States</p>

<p>Assumptions</p> <p>Stakeholders want to <u>more effectively</u> manage ambrosia beetles</p> <p>Period of project is sufficient to <u>successfully</u> improve ambrosia beetle management</p> <p>Reduced reliance on insecticides and sustainability of ornamental nurseries and orchard systems are desired goals</p>	<p>External Factors</p> <p>Continued support from universities, field stations and grower organizations.</p> <p>Rate of industry adoption of new, integrated practices for ambrosia beetle management.</p> <p>Unforeseen events/complications including weather, regulatory aspects of pesticides</p>
